Typical problems in the Kaniza Reservoir

The social situation is bad in Magyarkanizsa. The unemployment rate is outstandingly high, the industry is in ruins, the agriculture is not capable of providing the inhabitants. The population is aged, the migration is significant, and almost all the second houses are empty or offered for sale which caused the slump of the property. Because of these circumstances we are waiting for new possibilities in which your civilian initiative has the aim to try to manage the environmental challenge according to economic and social changes. I hope that we can work out our common plans within this programme.

The gipsy question is also present, but the problem is not so serious as the Romanian colleague mentioned. Managing the question not long ago a special occupation centre was established in Ada. We have further plans here I would like to mention the family aid programme where the children live in families, but nobody cares with them or the social circumstances are very poor we could support them effectively. We have another programmes like the employment and accommodation programmes but at present our resources are still incomplete.

I would like to thank you your attention.
